REGIONAL. NATIONAL. GLOBAL.

Axess-NOC™

Is a network-based suite of applications providing overall management of large multi-site remote *Axess*™ systems, deployed either on Regional, National or Global scales. *Axess-NOC*™ pulls data from all the remote systems connected then aggregates that data for use by the client applications *rOVIng*™ and *OverSite*™ to provide operators and management a centralized view of their network on a real time basis.
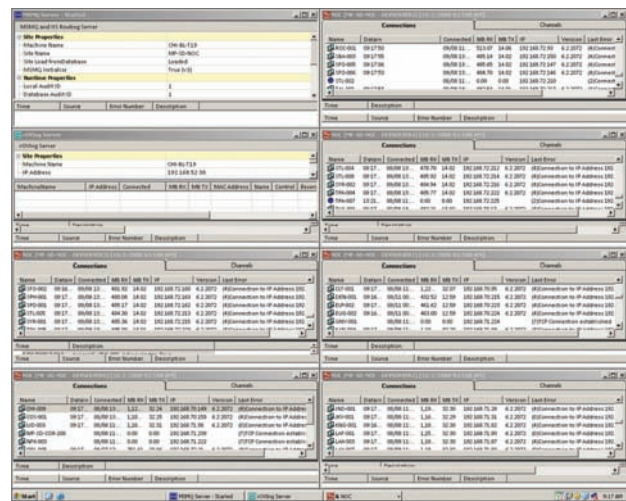

Axess-NOC can be installed in many configurations from a single machine, to a full redundant system giving you scalability to meet or exceed your uptime requirements.
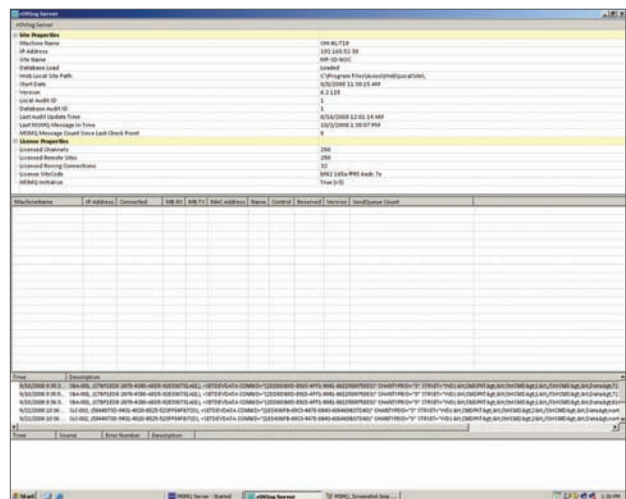

The Power of SQL

Axess-NOC leverages Microsoft® SQL Server® for system, data warehousing of logs and remote system data. These and other background operations are performed by *Axess-NOC's* sister application *StcBase*.™

Automatic Backup of Remote Sites

StcBase performs background tasks like synchronization of Database settings, for local offsite backups, to remote site Log gathering then used by *rOVIng* and *OverSite* clients for reporting purposes.
